

Dashboard Map

How the page is organized

1. Scope, controls, and summary

Last updated, selected window, theme/export controls, the 8 published repos premise, and the first metrics overview.

2. Lead story and next moves

A focused article carousel plus queue, both generated from the same rules-based prompts that connect metrics to repo context.

3. Opportunity map

Attention on the x-axis, downstream growth on the y-axis, and clone activity as mark size.

4. Code activity ribbon

Commit and release clusters sit near the traffic timeline without implying branch topology. Markers focus a repo when the cluster belongs to one repo.

5. Readiness queue

Community-health checks translated into practical setup fixes for the visible published repos.

6. Growth model

Attention, interest, and adoption cards summarize the path from visibility to downstream project response.

7. Repo strip and momentum

Published repo chips focus or compare the 8 selected repos; momentum summarizes streaks and notable days.

8. Tables

Sortable referrer, path, and repository detail surfaces for source inspection.

Reading model

The summary cards establish factual context; the lead story creates a focused read; the lower modules keep the evidence visible.

Scope, Controls, Summary, and Published Repos

What to look for

8 published repos

Publication is scoped to the selected set.

Summary cards

The first metrics strip anchors the lead story in visible counts before the user reads recommendations.

Window and metric controls

Changing the window or metric redraws charts, maps, tables, and recipes.

Repo chips

Click a published repo chip or card to focus it; modifier keys support compare-style selection where enabled.

Demo affordances

Export, theme, sorting, and focus controls are functional in the static dashboard.

Lead Story and Next Moves

The focused article creates the first read; the queue preserves the practical next-move list for scanning and repo focus.

What to look for

Purpose

Create an above-the-fold story without inventing analysis: the lead card reframes existing rules-based prompts as a focused read.

Carousel

Story tabs and arrow controls rotate through the strongest prompts for the selected window.

Affordance

Lead buttons and queue cards focus the associated repo across the dashboard.

Use case

Useful for flat or mixed windows because it emphasizes what to do next, not only what already spiked.

Opportunity Map

Opportunity map

Published repos by attention and downstream growth. Bubble size follows clone activity.

What to look for

Axes

Right means more attention; up means more downstream growth from stars, forks, and subscribers.

Bubble size

Size follows clone activity. The scale is compact so crowded portfolios still read cleanly.

Quadrants

Labels suggest practical recipes such as clarify next step or amplify.

Affordance

Points and right-side notes focus the repo. Hover/title text carries exact values.

Clustered demo data now uses smaller marks so labels and quadrants stay readable.

Code Activity Ribbon

Code activity ribbon

Commit and release clusters in the selected traffic window. Use it to inspect where code activity and attention sit near each other.

What to look for

Purpose

Bring default-branch commits and releases into the same time window as traffic, so maintainers can inspect temporal adjacency.

Encoding

Daily clusters aggregate commits and releases; releases use the stronger diamond marker.

Nearby views

Tooltips and log items show nearby traffic counts as context for follow-up.

Affordance

Single-repo clusters and log rows focus the repo inside the dashboard; multi-repo clusters stay as contextual hover targets.

A low-noise event layer for spotting traffic-adjacent codebase activity.

Readiness Queue

A compact path from current attention to public-facing setup improvements.

What to look for

- Purpose**
Convert attention into practical maintenance actions: README, license, contributing guide, templates, and conduct files.
- Score**
The score uses known community-health checks and reports visible coverage.
- Priority**
Repos with setup gaps and current views plus clones rise in the queue.
- Affordance**
Fix cards focus the repo and make the next maintenance step explicit.

Tables and Source Inspection

Repositories

Focus or compare repositories from the published set.

REPOSITORY	VIEWS	VISITORS	CLONES	GROWTH	COMMUNITY	TREND	SHARE OF VIEWS
☐ reponomics-demo/demo-app-starter	1,213	623	150	+4 stars +1 watchers +1 forks (43) (10) (6)	98% 5/6 files - Docs linked		18.1

☐ reponomics-demo/demo-sdk-python	424	224	80	+2 stars +0 watchers +0 forks (71) (18) (9)	90% 6/6 files - Docs linked		6.6

Use the tables when you need the underlying rows behind a visual or prompt.

What to look for

Referrers

Shows where attention came from in the selected window; column headers sort the table.

Popular paths

Useful for spotting docs, release notes, or entry pages that deserve a clearer next step.

Repositories

Detailed per-repo metrics backstop the heuristic sections with raw values.

Mobile behavior

Wide tables scroll inside the table area so the page layout remains stable.
